DET3 Series
Insert Manual

For complete installation instructions, see the Tube Heater General Manual that accompanies this Series Insert Manual.

The DET3 Series Infrared Tube Heater is a positive pressure, two-stage radiant heater system. This insert manual is a supplement to the Tube Heater General Manual and provides specific information related to the DET3 Series model. All persons involved with the installation, operation and maintenance of the heater system must read and understand the information in this insert manual and the accompanying Tube Heater General Manual.

⚠️ WARNING

Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury or death. Read the installation, operation and maintenance instructions thoroughly before installing or servicing this equipment.

This heater must be installed and serviced by trained gas installation and service personnel only. Failure to comply could result in personal injury, asphyxiation, death, fire or property damage.

In locations used for the storage of combustible materials, signs must be posted to specify the maximum permissible stacking height to maintain the required clearances from the heater to the combustibles. Signs must either be posted adjacent to the heater thermostats or in the absence of such thermostats, in a conspicuous location.

Not for residential use! Do not use this heater in the home, sleeping quarters, attached garages, etc. Installation of a commercial tube heater system in residential indoor spaces may result in property damage, serious injury, asphyxiation or death.

For Your Safety

If you smell gas:

• Do not try to light any appliance.
• Do not touch any electrical switch.
• Do not use any phone in your building.
• Immediately call your gas supplier from a neighbor’s phone.
• Follow the gas supplier’s instructions.
• If you cannot reach your gas supplier, call the fire department.

Keep these instructions for future reference.

1.0 Safety

Read and understand all safety information and warnings in this Insert Manual and the Tube Heater General Manual before installation, operation and maintenance of the radiant tube heater system.

Safety Labels and Their Locations

Product safety signs or labels should be replaced by the product user when they no longer are legible. Contact either your local distributor or the product manufacturer for obtaining replacement signs or labels.

### Clearance to Combustibles

**WARNING**

Placement of explosive objects, flammable objects, liquids and vapors close to the heater may result in explosion, fire, property damage, serious injury or death. Do not store, or use, explosive objects, liquids and vapor in the vicinity the heater.

Clearance to Combustibles is defined as the minimum distance that must exist between the tube surface, or reflector, and any combustible items (see Figure 1.1). It also pertains to the distance that must be maintained from moving objects around the tube heater.
When installing the tube heater system, clearances to combustibles for the model tube heater and configuration must be maintained. Refer to Chart 1.1 below to determine the required distances for your model.

**Chart 1.1 • Clearance to Combustibles in Inches** (see Figure 1.1 for Mounting Angles)

*Heaters mounted on an angle between 0° to 45° must maintain clearances posted for 0° or 45°; whichever is greater.

The stated clearance to combustibles represents a surface temperature of 90°F (32°C) above room temperature. Building materials with a low heat tolerance (such as plastics, vinyl siding, canvas, tri-ply, etc.) may be subject to degradation at lower temperatures. It is the installer's responsibility to assure that adjacent materials are protected from degradation.

2.0 Installation

WASHINGTON

Improper installation, adjustment, alteration, service or maintenance can cause property damage, serious injury or death. Read and understand the installation, operating and maintenance instructions thoroughly before installing or servicing this equipment. Only trained, qualified gas installation and service personnel may install or service this equipment.

**Not for residential use!** Do not use this heater in the home, sleeping quarters, attached garages, etc. **Installation of a commercial tube heater system in residential indoor spaces may result in property damage, serious injury or death.**

Instructions for the following are detailed in the Tube Heater General Manual:

- Design considerations
- Hanger suspension and placement
- Tube layout and assembly
- Burner control box suspension
- Reflectors (and accessories)
- Venting and combustion air intake
- Gas requirements
- Baffle assembly

**NOTE:** Electronic versions of all manuals are available at www.detroitradiant.com

### Gas Requirements

<table>
<thead>
<tr>
<th>Type of Gas</th>
<th>Required Manifold Pressure</th>
<th>Minimum Inlet Pressure</th>
<th>Maximum Inlet Pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natural</td>
<td>3.5 inches W.C.</td>

<td>14.0 inches W.C.</td>
</tr>
<tr>
<td>Liquefied Petroleum</td>
<td>10.0 inches W.C.</td>
<td>11.0 inches W.C.</td>
<td>14.0 inches W.C.</td>
</tr>
</tbody>
</table>

**IMPORTANT:** Consult the Tube Heater General Manual for gas connection requirements.

### Electrical Requirements

- 120VAC-60 Hz., single-phase, 3-wire.
- 24VAC thermostat connection.
- Starting current 1.7 amps
- Running current 1.1 amps

**NOTICE**

Connecting the thermostat with a voltage other than 24VAC may damage the heater. The DET3 Series requires a 24VAC connection to the thermostat. The DET3 Series is equipped with an internal relay board. A field supplied external transformer must be installed, see wiring diagram (Figures 2.1A-B).

**NOTE:** A yellow control wire replaces the external terminal plug on stainless steel models or models with water resistant upgrades.
Wiring

A WARNING

Electric Shock
Field wiring to the tube heater must be connected and grounded in accordance with national, state, provincial, local codes and to the guidelines in the Tube Heater General Manual and Series Insert Manual. In the United States refer to the most current revisions to the ANSI/NFPA 70 Standard, and in Canada refer to the most current revisions to the CSA C22.1 Part I Standard.

Figure 2.1 - Field Wiring Diagrams

* Model requires stainless steel tube clamp (P/N: TP-220) to be located at the seam between the primary combustion chamber and the secondary combustion tube downstream of the burner control box.
** Model requires 5EA-SUB accessory package when installing in a 'U' configuration (P/N: TF1B).
^ Factory recommended mounting heights are listed as a guideline.

**IMPORTANT:** Reference box label to determine the quantity of required baffle sections for each model heater.

HRT = Uncoated hot-rolled steel.
Alum = Black coated aluminized treated steel.
Titan = Black coated titanium stabilized aluminized steel.
Figure 2.4 • Tube Installation Sequence

Important! The combustion chamber(s) & radiant tube section(s) must be installed in the following order.

20 Foot

30 Foot

40 Foot

Aluminized steel secondary combustion chamber location on 150-200 MBH models.

50 Foot

Stainless steel clamp location on 175 - 200 MBH models (P/N: TP-220).

60 Foot

Aluminized steel secondary combustion chamber location on 150-200 MBH models.

Key

Burner Control Box with 16” Burner Tube

Hot-rolled Steel Radiant Emitter Tube

Primary Combustion Chamber Tube

Standard Tube Clamp

Secondary Aluminized Steel Combustion Chamber (150-200 MBH models only)

Stainless Steel Tube Clamp (P/N: TP-220)

175-200 MBH models only - Located between 1st and 2nd 10 ft. tube sections.

Baffle Location

NOTE: Refer to the Tube Heater General Manual, Chart 3.6 (page 23) for secured reflector joints.
NOTE: Reference Tube Heater General Manual for installation requirements.

**Sequence of Operation**

Two voltages (120VAC supply and 24VAC control) must be supplied to the DET3 Series burner control box for proper operation.

**Starting Circuit:** Upon a call for heat, the low fire relay is energized by 24VAC from the thermostat. The relay is closed sending 120VAC to the blower beginning the sequence of operation.

Air pressure generated by the blower causes the normally open pressure switch to close, sending power to the ignition module. After a seven-second pre-purge, the spark electrode, transformer and gas valve are simultaneously energized. The trial for ignition is 15 seconds.

**Single Stage Running Circuit:** After ignition, the electrode monitors burner flame. If sense of flame is lost, the control immediately disrupts power to the gas valve and then re-cycle the unit (identical to the starting sequence). If flame sense is not established within 15 seconds, the heater will attempt two (2) additional ignition sequences before proceeding to lockout mode. The control can be reset by briefly interrupting the power source.

**Two Stage Running Circuit:** High fire operation is actuated by the thermostat sending a 24VAC signal to the high fire relay. The energized coil of the relay is closed, allowing 24VAC to continue onto the high fire of the gas valve.

**Figure 3.1 • Operational Indicator Light**

- Light 1 Indicates High Fire Mode
Thermostat

**NOTE:** Different thermostats operate according to their particular features. Refer to thermostat specifications for details.

DET3 Series heaters require a 24VAC, two stage thermostat to operate. The burner control box is equipped with a round terminal strip that accepts three (3) 1/4 in. female spade terminals. Do not supply 120VAC to the 24VAC connection.

**Example:** Desired room temperature is 65° F. The preset differential of the thermostat is 1° F. The preset differential for High fire mode is 3° F.

When the temperature drops below the Low Fire preset differential of the thermostat (63° F), Low Fire will activate. If the temperature continues to drop below the preset differential for High Fire, High Fire will activate bringing the temperature back up to the Low Fire preset quickly.
Turn up thermostat.

Does the fan blower turn on?

Does the igniter spark?

During the ignition trial, does the gas valve open?

Does the burner light?

Is the valve switch in the ON position?

Find the source of the electrical problem.

Is the igniter physically damaged?

Check the gap on the igniter. Is the gap between 3/16 in. and 1/4 in.?

Test for 24VAC at the gas valve during valve opening (typically 10 seconds after power to the heater). Is there 24VAC to the valve?

Check that gas pressure is within minimum and maximum inputs as indicated on the heater's rating plate. Is gas pressure ok?

The circuit board and/or wiring harness could be faulty. These should be replaced.

Correct problem.

Replace 24VAC transformer.

Is 120VAC being sent to the transformer?

Is 120VAC being sent to the transformer?

Replace igniter.

Adjust gap.

Replace gas valve.

Replace gas valve.
Correct wiring or replace relay.

Is there 120VAC coming to the fan from the low fire relay?

Yes: The blower is faulty and must be replaced.

No:

Remove obstruction

Is the inlet or outlet of the unit obstructed? i.e. ice, birds nest, dirt, etc.

Yes: Check for loose wiring or restrictions in hose connections to the pressure switch. Are they ok?

No: Repair wiring or hose connections.

No:

While the switch is temporarily bypassed, check for 120VAC from the switch to the circuit board. Does 120VAC enter the circuit board?

Yes: The heater is equipped with a safety differential pressure switch. The switch is a normally open switch and is located in the air chamber. Temporarily place a jumper across the terminal of the switch. Does the igniter spark?

No: Replace the pressure switch after verifying the following:

- Baffle(s) is in the tube farthest from the burner.
- Heater, blower, squirrel cage, intake and exhaust are clean and free from dirt and obstructions.
- The 4 in. dia. air intake pipe does not exceed 20 ft. and/or two elbows.
- There is not a negative pressure experienced at the area of air intake (i.e. attic space, high winds, very tight buildings, etc.)

If any of the above were occurring, please address the problem.
Continued from page 14.

Check that gas pressure is within minimum and maximum inputs as indicated on the heater's rating plate. Is gas pressure ok?

Check that gas supply pressure meets minimum and maximum requirements.

Does the burner stay on briefly and then shut off?

Does the burner stay on?

Check the gap on the igniter. Is the gap between 3/16 in. and 1/4 in.?

The following can cause the heater to shut down:
- Improper grounding.
- High winds.
- Taking combustion air from the attic.
- Dirty environment.
- Baffle not located properly.
- Fluctuating gas pressure.

Flame Current Check: Single Spark & Sense

To measure flame current, disconnect input voltage, then insert a 0-50 μA DC meter and capacitor in series with the spark electrode as shown below. Reconnect input voltage and initiate call for heat. After sparking is complete and flame is established, meter should read 1.0 μA or higher while flame is established. If meter reads below “0” on the scale, meter leads are reversed. Disconnect power and reconnect meter lead for proper polarity.
DET3 Series

Check that gas pressure is within minimum and maximum inputs as indicated on the heater's rating plate. Is gas pressure ok?

- Yes
  - Is the gap on the igniter between 1/8 in. and 3/16 in.?
    - Yes
      - Correct problem.
    - No
      - Adjust gap.
  - No
    - Purge gas lines.

Differential switch may be faulty or there is a restriction in the exhaust or intake.

- Yes
  - Is the gap between 1/8 in. and 3/16 in.?
    - Yes
      - Correct problem.
    - No
      - Replace.
  - No
    - Replace.

If heater does not enter high fire mode, check the following:

**NOTE:** To confirm the heater is not in high-fire mode, check the manifold pressure (3.5 inches W.C. natural gas or 10 inches W.C. propane gas). If the indicator light is not illuminated, it is faulty and should be replaced. If the manifold pressure ranges from 2.3 to 2.8 inches W.C. natural gas (model dependent) and 6.0 to 7.5 inches W.C. propane gas (model dependent), the heater is in low fire mode and the troubleshooting steps described below should be followed.

Check the spark electrode. Is the ceramic cracked or loose?

- Yes
  - Replace electrode.
- No
  - Electrode sensing may be faulty or flame signal may be weak. Check that heater is operating at proper gas pressure as indicated on the rating label. Clean or replace electrode if needed.

Check for damaged insulation or loose terminals on the high voltage spark wire. Is it ok?

- Yes
  - Replace.
- No
  - Check that gas pressure is within minimum and maximum inputs as indicated on the heater's rating plate. Is gas pressure ok?
    - Yes
      - Differential switch may be faulty or there is a restriction in the exhaust or intake.
    - No
      - Correct problem.

Were the gas lines purged of air?

- Yes
  - Check for damaged insulation or loose terminals on the high voltage spark wire. Is it ok?
    - Yes
      - Replace.
    - No
      - Check that gas pressure is within minimum and maximum inputs as indicated on the heater's rating plate. Is gas pressure ok?
        - Yes
          - Differential switch may be faulty or there is a restriction in the exhaust or intake.
        - No
          - Correct problem.
    - No
      - Purge gas lines.
- No
  - Check that gas pressure is within minimum and maximum inputs as indicated on the heater's rating plate. Is gas pressure ok?
    - Yes
      - Differential switch may be faulty or there is a restriction in the exhaust or intake.
    - No
      - Correct problem.

Check for 24VAC across the COM and HIGH on the 24VAC terminal. Is there 24VAC?

- Yes
  - Is there 24VAC across the red wire on the relay board and ground on the circuit board?
    - Yes
      - Replace gas valve.
    - No
      - Repair or replace faulty wiring or thermostat
- No
  - Replace relay.

* Filled By: ________________

**Not included when heater is equipped with yellow control cord.**

**One 4” stainless steel tube clamp (P/N: TP-220) is provided for each 175,000 - 200,000 BTU model.**

Place as shown on page 11.

## Approvals

- CSA
- Commercial approval.

## Limited Warranty

- 1 year - Burner box components.
- 2 years - Combustion and radiant tubes.
- 3 years - Stainless steel burner.
